EDUCATION

BE Electronics & Telecommunication Engineering

Lokmanya Tilak college of Engineering

- **Coursework:** Minor in Data structures & Algorithms

Nov 2022 – Jun 2026

Navi Mumbai

EXPERIENCE

JIO | Software Development Engineer Intern

Dec 2025 – Feb 2026

- Engineered and integrated backend REST APIs with nodejs and PostgreSQL, reducing data transfer latency by 25% through optimized query execution and indexing.
- Managed development workflows using Git and CI/CD pipelines, reducing bug resolution time through streamlined code reviews and task tracking.
- Developed and launched 3 new frontend features for a production-level internal platform using React.js, Next.js, and TypeScript within 4 weeks.

Open Source Contributor | SDE

2026

- **Corsair (YC W25)** – Merged two plugin fixes, PR(#1816) making Harvest fail fast with a clear auth error instead of sending an empty Bearer token, and PR(#1821) removing a dead example webhook from Spotify along with its docs.
- **PR(#9019)** – Fixed Movable Do and scale-degree bugs in Music Blocks (Sugar Labs, ~900) with Jest regression tests; merged upstream.
- **PR(#155)** – Built threading for OpenRig's (3.2k) Slack gateway so follow-up updates post into the original item's thread, with a DB migration, safe fallbacks and 20+ tests; maintainer-approved and queued for release.

CONCERTO | Frontend Developer Intern

Jan 2024 – Feb 2024

- Engineered a fully responsive company homepage with React, Tailwind CSS, and JavaScript, creating a mobile-first design system and reusable components, which led to faster page loads and positive user feedback
- Designed and implemented a secure user authentication flow-including sign-up and login pages, client-side form validation, and session handling-reducing onboarding friction and decreasing login errors for new users
- Evaluated frontend frameworks (React, Vue, and others) against project constraints and tight deadlines, then built and shipped a working prototype on schedule to guide the team's technology decision
- Enhanced the average Lighthouse performance score from 80 to 96.5 by implementing code-splitting, image optimization, and lazy loading.

PROJECTS

FORGEAI | [LIVE](#)

- Architected a full-stack AI code-generation platform using Next.js and Prisma, enabling users to generate and preview functional React applications in under 10 seconds.
- Engineered a real-time generation pipeline integrating Google Gemini via server-sent events, with JSON schema validation and multi-model fallback for reliable structured output under failure
- Designed a relational data layer (Prisma + PostgreSQL) to persist user workspaces, chat history, and generated files as structured JSON, enabling full project history and retrieval
- Developed an in-browser live code execution/preview environment (Sandpack) with incremental file patching to avoid UI remounts, plus one-click ZIP export of generated projects
- Tech: Next.js, React, TypeScript, PostgreSQL, Prisma, Clerk, Google Gemini, Cline SDK, Sandpack, Arcjet

WEBSCRAPER | [GitHub](#)

- Automated a scraping pipeline with node-cron, processing over 5,000 articles daily to provide real-time sentiment analysis and trend visualization.
- Designed REST APIs with Express.js (MVC) and stored data using MongoDB; containerized the app with Docker and tested cross-browser compatibility via BrowserStack.
- Orchestrated a React (Vite) dashboard utilizing Chart.js, enabling real-time visualization of over 500 article insights and improving content analysis efficiency by 30%
- *Tech: Node.js, Selenium WebDriver, Express.js, MongoDB, Docker, React, Vite, Chart.js*

XAI | [Github](#)

- Built a Flask web app that uses **Google Gemini Vision API** to extract clinical data from medical reports and run ML predictions (Random Forest & TensorFlow) for Kidney and Lung disease diagnosis
- Integrated **SHAP explainability visualizations** to make AI predictions interpretable, bridging the gap between model output and clinical decision-making
- Deployed end-to-end on **Render with GitHub CI/CD**, handling full pipeline from unstructured PDF ingestion to downloadable diagnostic PDF reports
- *Tech: Flask, Google Gemini Vision API, Random Forest, TensorFlow, SHAP, Render, GitHub CI/CD*

SKILLS

- **Languages:** JavaScript, TypeScript, C++, Python, Java
- **Frameworks/Tools:** React.js, Next.js, Node.js, Express.js, Git
- **Databases/Other:** MySQL, MongoDB, Redis, Firebase, Docker, CI/CD

ACHIEVEMENTS & ACTIVITIES

- **Published Research Paper:** "Explainable AI for Disease Diagnosis," IRE Journals (Mar 2026); applied Random Forest and CNN-based deep learning for CKD and lung disease detection with SHAP and Grad-CAM interpretability.
- **Head of Management & Sponsorships for college technical fest:** FY 2023–2024.
